Introduction

During the Summer of 2021, I served as the Communication Intern for MUSC Women's Health and Children's health. One of my main duties was to write articles from MUSC's Health Blog Advance. I am now approaching the 1 year mark at MUSC and have had numerous articles published. However, I was not able to do with without the help of Dr. Craig’s Writing For the Web course and Dr. Devet’s technical writing course.

Course Impact

Writing for the Web: Dr. Craig's course focused on preparing content that made the most sense for your audience. This included maximizing space, improving readability, and choosing appropriate language for your target audience. These were all skills that came into play when trying to explain women's health issues to a versatile audience.

Technical Writing: Dr. Devet’s technical Writing class came to life when I was writing these articles. When discussing medical terms, it is expected that you must use layman’s terms to explain topics to your audience. This is exactly what technical writing is all about. By using what I learned in Technical writing, I was able to make my articles more understandable to a wide variety of audiences.
